## Intel<sup>®</sup> oneAPI VTune<sup>™</sup> Profiler 2021.1.1 Gold

**Elapsed Time:** 0.215s

Application execution time is too short. Metrics data may be unreliable. Consider reducing the sampling interval or increasing your application execution time.

Back-End Bound:

7.5% of Pipeline Slots
0.0% of Pipeline Slots
26.7% of Pipeline Slots

A significant portion of pipeline slots are remaining empty. When operations take too long in the back-end, they introduce bubbles in the pipeline that ultimately cause fewer pipeline slots containing useful work to be retired per cycle than the machine is capable to support. This opportunity cost results in slower execution. Long-latency operations like divides and memory operations can cause

this, as can too many operations being directed to a single execution port (for example, more multiply operations arriving in the back-end per cycle than the execution unit can support).

This metric represents how much Core non-memory issues were of a bottleneck. Shortage in hardware compute resources, or dependencies software's instructions are both categorized under Core Bound. Hence it may indicate the machine ran out of an 000 resources, certain execution units are overloaded or dependencies in program's data- or instruction- flow are limiting the performance (e.g. FP-chained long-latency

arithmetic operations).

**Divider:** 1.0% of Clockticks **Port Utilization:** 20.9% of Clockticks

Issue: A significant fraction of cycles was stalled due to Core non-divider-related issues.

Tips: Use vectorization to reduce pressure on the execution ports as multiple elements are calculated with same uOp.

**Average CPU Frequency:** 2.657 GHz

**Total Thread Count:** 1 **Paused Time:** 0s

## **Effective Physical Core Utilization:** 22.9% (0.914 out of 4)

The metric value is low, which may signal a poor physical CPU cores utilization caused by:

- load imbalance
- threading runtime overhead
- contended synchronization
- thread/process underutilization
- incorrect affinity that utilizes logical cores instead of physical cores

Explore sub-metrics to estimate the efficiency of MPI and OpenMP parallelism or run the Locks and Waits analysis to identify parallel bottlenecks for other parallel runtimes.

## **Effective Logical Core Utilization:** 11.4% (0.914 out of 8)

The metric value is low, which may signal a poor logical CPU cores utilization. Consider improving physical core utilization as the first step and then look at opportunities to utilize logical cores, which in some cases can improve processor throughput and overall performance of multi-threaded applications.
